

A. LIST OF HANTS FUNGI.

(Continued from Page 42, Part III.)

BY REV. W. L. W. EYRE.

The enumeration of the Lactarii and Russulæ completes for the present our list of the Hants Fungi, *i.e.*, of the gill-bearing species. There are two other groups, Polyporus and Hydnum containing large and noticeable forms. So full a list as we have been able to present is, greatly due to the autumn excursions of the Club, and the valuable personal assistance of Dr. M. C. Cooke on these occasions. His identifications of these difficult plants are marked,* partly for the satisfaction of the student, and because many which apparently have not been found in the northern part of the county have been detected in the New Forest.
